## The association between weight stigma and mental health: A meta-analysis

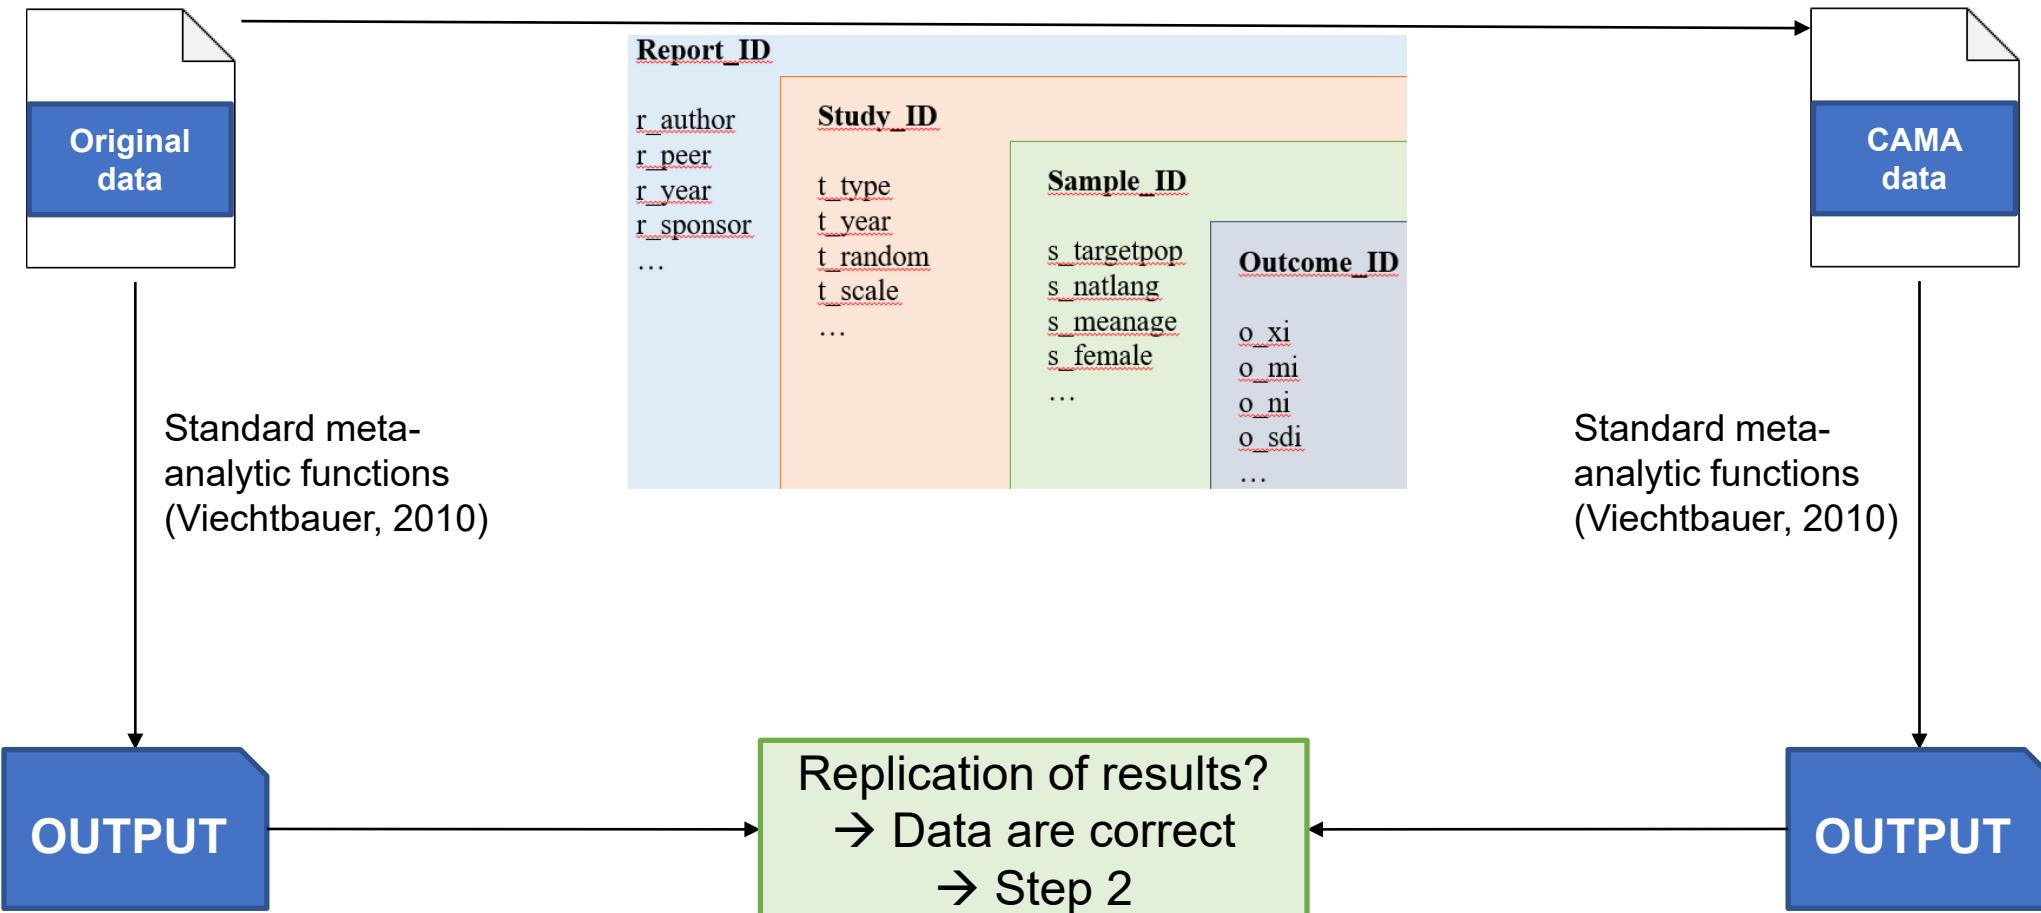

Christine Emmer<sup>1</sup> | Michael Bosnjak<sup>2</sup> | Jutta Mata<sup>1</sup>

Separate Three-Level Meta-Analyses Under Random Effects Assumption for the Types of Weight Stigma and Mental Health

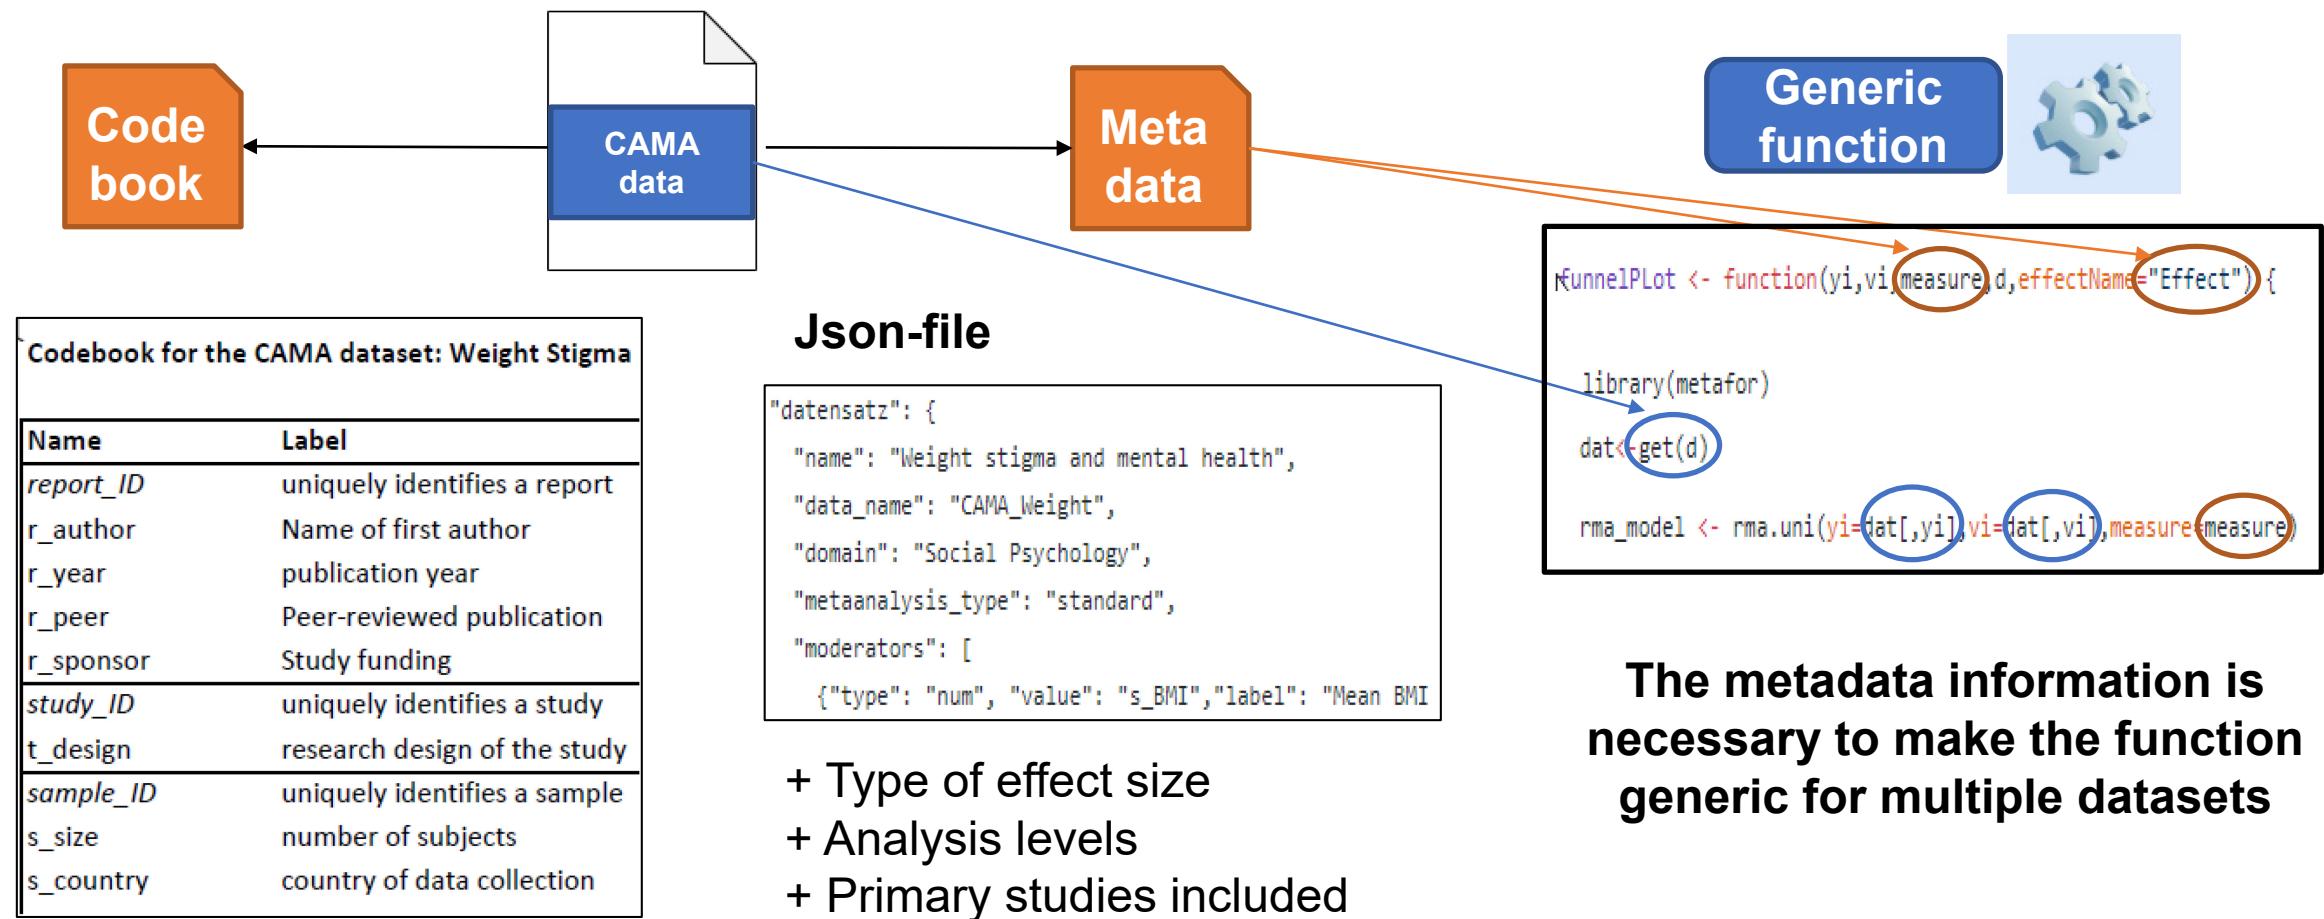

Stigma type	r	k	95% CI	$\sigma^2_1$	$\sigma^2_2$	$\rho$	Residual heterogeneity
Self-stigma	-.39***	222	[-.43, -.34]	.18	.12	.69	$Q(221) = 4,492.51***$
Public stigma	-.33***	241	[-.36, -.29]	.09	.12	.37	$Q(240) = 57,537.80**$
Structural stigma	-0.28***	8	[-.37, -.19]	.08	.00	1.00	$Q(7) = 18.26**$
Implicit stigma	-0.17***	11	[-.24, -.09]	.00	.00	.29	$Q(10) = 6.00$

Note. To investigate the exploratory Research Question 1, separate meta-analyses were conducted for the different types of weight stigma and mental health outcomes: for (1) self-stigma, (2) public stigma, (3) structural stigma, and (4) implicit stigma. r = Pearson's product moment correlation; k = number of effect sizes; CI = confidence interval;  $\sigma^2_1$  = variance within studies (Level 2);  $\sigma^2_2$  = variance between studies (Level 3);  $\rho$  = intraclass correlation coefficient. \*  $p < .05$ ; \*\*  $p < .01$ ; \*\*\*  $p < .001$ .

# Implementation in PsychOpen CAMA: Step 1

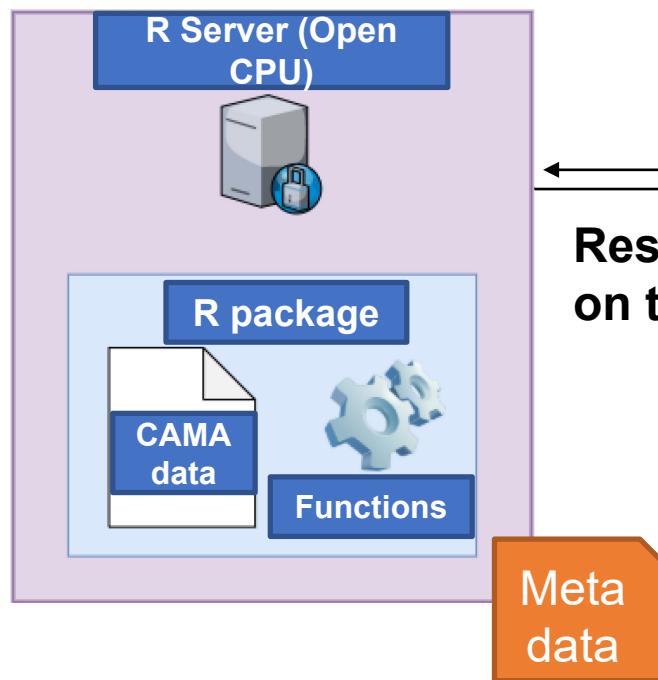

# Implementation in PsychOpen CAMA: Step 2

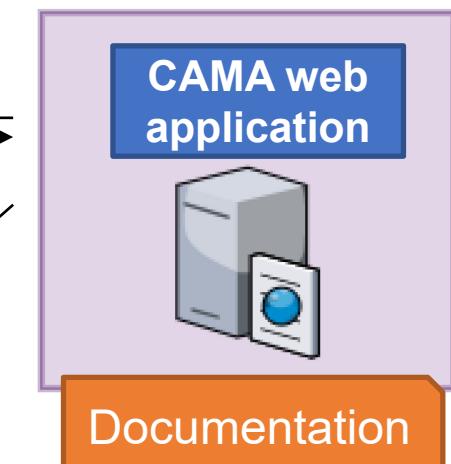

**The metadata information is necessary to make the function generic for multiple datasets**

# Implementation in PsychOpen CAMA: Step 3

users via interface

Results from analyses  
on the server

# Replication in the webapp

→ Live Demonstration

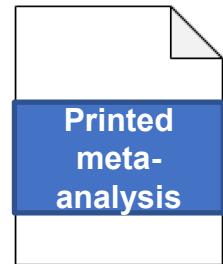

# Further Challenges

- Automation of data implementation and update
  - Relies on cooperation of the research community
  - Data submission via Submission Assistant in PsychArchives
  - Quality control needed!
- Implementation of further methodological approaches with different data structures
  - Network Meta-analysis
  - AD-IPD
  - MASEM

# From static to dynamic meta-analyses

## Requirements:

Access to complete meta-analytic data & thorough documentation of methodology

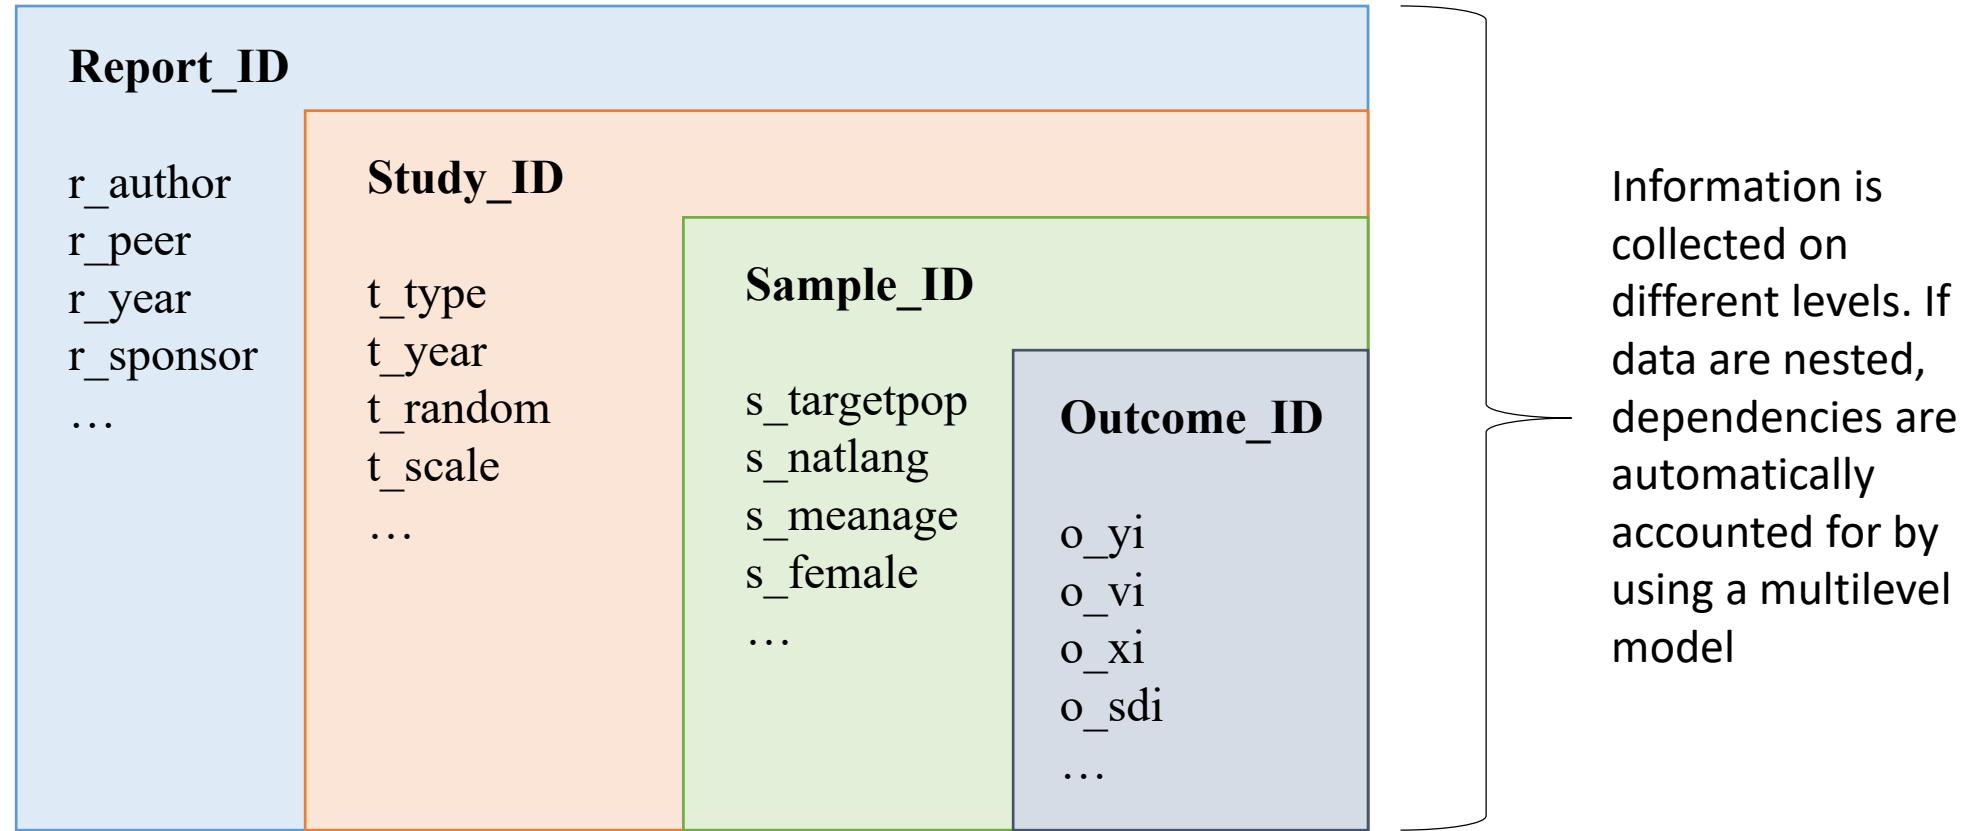

- **Fixed:** Interpretation and discussion of results under certain methodological assumptions and decisions
- **Static:** Overview on a research question at a certain point in time

- **Flexible**
  - Analyses can be replicated
  - Robustness of results can be checked by varying subjective decisions
- **Dynamic**
  - Data can be re-used for other analysis purposes
  - Data can be updated more efficiently and faster

# Data template

The naming of study outcomes and the type of effect size measure used in the meta-analysis (in the metadata) follows the metafor package (Viechtbauer, 2010). As we use this package as the basis for effect size calculation and most of the meta-analytic outputs, consistent naming makes life easier.
